

Alexander M. Nicoara (A20301259)
CS450: Operating Systems
Programming Assignment 1
Professor Leung

OS Platform

This program runs on Linux (Ubuntu).

How to Build, Execute, and Terminate

To build and run the modified xv6 shell, here are the following steps:

1. Open a command line terminal.
2. Navigate to the directory /Lab1-Nicoara, then navigate to xv6-public (which is inside Lab1-Nicoara).
3. Once you cd into xv6-public, run `gcc sh.c` in the command line to compile the modified shell code.
4. Next, run `./a.out` in the command line to run the modified shell code.
5. When you are ready to exit the shell, press `CTRL-C` to terminate the program.
